VERTIV HOLDINGS CO

NYSE: VRT | Power, thermal and liquid cooling infrastructure for AI data centres | United States

Tommy Lau | 6 October 2026 | Initiation of coverage | Independent research

INITIATE AT LONG	**Target price:** US$300.00	**Last price:** US$253.62 (NYSE close, 5 Oct 2026)	**Upside:** +18%

The market has sold Vertiv as a volume story. Its margin says each megawatt is worth more.

Vertiv makes the power and cooling equipment inside AI data centres. Its shares closed at US$253.62 on 5 October 2026, a third below their May peak, in a year when Vertiv twice raised its own guidance and widened its margin by four points. The market fears AI data centre spending is near its peak, that supply is congested and that the backlog has gone quiet.

My answer comes from the claim I made in September: Vertiv is paid per megawatt, and AI has made every megawatt harder to build. The number to watch is not how many megawatts get built but how much Vertiv earns on each one. That number is still rising, and the shares no longer pay for it.

I initiate at LONG with a twelve-month target of US$300, about 28 times my 2028 earnings estimate of US$10.65 and 18% above the price. Conviction is medium, not high, because the bear case is a 29% fall and the third quarter results land within weeks.

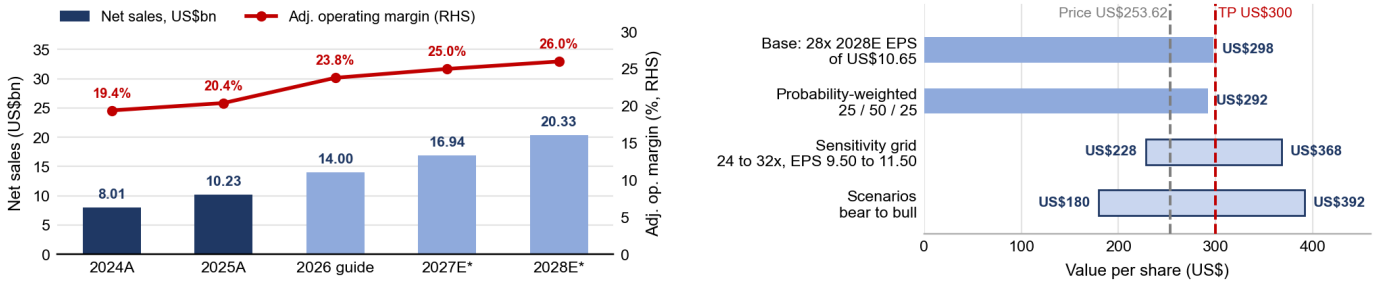

Stock data	
LAST PRICE	**US$253.62, NYSE close 5 Oct 2026**
PEAK	**US$379.94 intraday, 14 May 2026; price now 33% below**
DILUTED SHARES	**392.7m, Q2 2026 weighted average (10-Q)**
MARKET VALUE	**US$99.6bn**
NET CASH, 30 JUN 2026	**US$170.8m (cash US$2,810.6m + short-term investments US$300.0m less debt US$2,939.8m)**
ENTERPRISE VALUE	**US$99.4bn**
P/E, 2026 GUIDE MIDPOINT	**37.9x (US$6.70)**
P/E, 2027 CONSENSUS	**28.4x (US$8.93, MarketBeat)**
FORWARD P/E, STOCKANALYSIS.COM	**32.1x**
2026 GUIDE (29 JUL 2026)	**Sales US$13.8 to 14.2bn; adj. operating margin 23.3 to 24.3%; adj. EPS US$6.65 to 6.75**
CONVICTION AND HORIZON	**Medium; 12 months, to October 2027**
YEAR END	**31 December**

Key financials

US$ billion unless stated	2024A	2025A	2026 guide	2027E*	2028E*
Net sales	8.01	10.23	13.8 to 14.2	16.94	20.33
Net sales growth (%)	n.a.	28	37	21	20
Adjusted operating margin (%)	19.4	20.4	23.8	25.0	26.0
Adjusted operating profit	1.55†	2.09†	3.33	4.24	5.29
Adjusted EPS (US$)	2.85	4.20	6.65 to 6.75	8.53	10.65
Adjusted EPS growth (%)†	n.a.	47	60	27	25
P/E at US$253.62 (x)			37.9	29.7	23.8

**2027E and 2028E are my own estimates, not Vertiv's. 2024A and 2025A sales and margins are the sums of the four quarterly results releases; EPS is as reported for the full year. 2026 is Vertiv's guide of 29 July 2026; growth, margin, operating profit and P/E use the midpoints. †Derived: operating profit as sales x margin; EPS growth from the figures shown. My 2027E EPS sits about 4.5% below the US$8.93 consensus.*

Two charts: a margin still rising, and a valuation that sits above the price

Left: net sales and adjusted operating margin, 2024A to 2028E. 2024A and 2025A per Vertiv's results releases; 2026 is the guide midpoint; 2027E and 2028E are my estimates. Right: value per share from the base case, the probability-weighted cases, the sensitivity grid and the bear to bull range, against the US$300 target (red) and the US$253.62 price (grey).

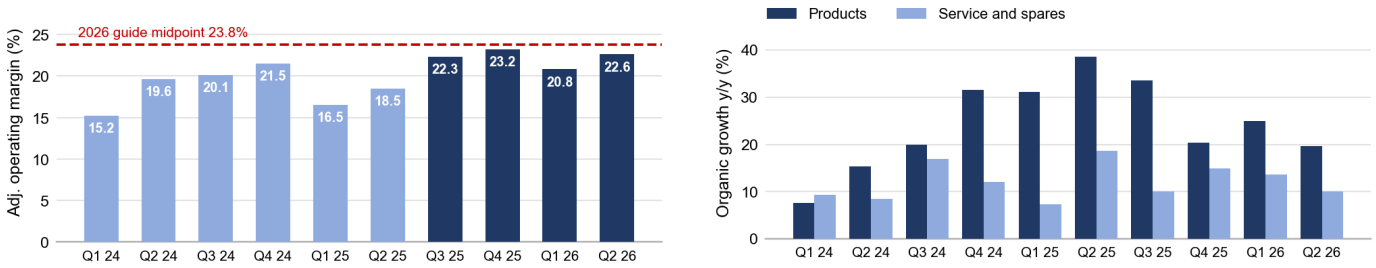

The thesis: each megawatt holds more of what Vertiv makes

Think of the electrician from the September piece. For years every new house needed the same fuse box. Now each house wants a heat pump, an induction hob and a car charger, so the job inside every house has grown. The electrician gains twice: more houses, and a bigger job in each.

Vertiv is that electrician inside an AI data centre. An AI cabinet draws more than 130 kilowatts, against 5 to 12 kW for an ordinary server rack. Air cannot carry that heat away, so the heat leaves through liquid, which needs coolant distribution units, pipework and heat exchangers on every row. The power side is moving to 800 volts of direct current, which needs new conversion equipment. Each megawatt of AI capacity holds more of what Vertiv makes, and more complicated versions of it.

The money should show this in one place above all: margin. Adjusted operating margin is the share of each sale left after running costs, with one-off items stripped out. If Vertiv were only selling more of the same boxes into a boom, margin would drift with volume and then fall as rivals added capacity. If each megawatt holds richer equipment, margin should keep rising while sales grow.

It has. Every quarter since the third quarter of 2025 has beaten the same quarter a year earlier, by 1.7 to 4.3 points, while sales kept rising. The second quarter of 2026 reached 22.6%, up 4.1 points, on sales of US$3.27 billion. Vertiv now guides to 23.3 to 24.3% for the full year, and to 24 to 25% for the third quarter. At its investor conference in May it set a target of about 27% or more by 2030.

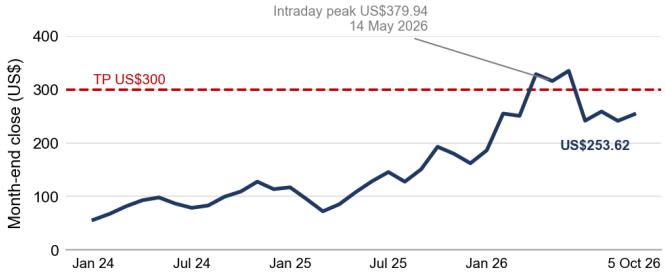

Left: adjusted operating margin by quarter, Q1 2024 to Q2 2026; dark bars are the four quarters since Q3 2025, each of which beat the same quarter a year earlier. The first quarter is always the softest. Right: organic growth, products against service and spares; stripped of acquisitions and currency, service grew more slowly than products in nine of these ten quarters. Source: Vertiv quarterly results releases, 24 April 2024 to 29 July 2026, including the organic growth reconciliation tables.

Service is not the proof. Reported service revenue grew 33% against 22% for products, but those figures are swollen by acquisitions. Stripped of acquisitions and currency, service grew about 10% and products about 20%, and service has grown more slowly than products in nine of the last ten quarters. The claim that what Vertiv sells per megawatt is rising rests on margin, which is the stronger test anyway. This call rests on margin and not on service.

Variant perception: what the market prices in, and where I differ

At US$253.62 Vertiv is valued at about US$99.6 billion on its diluted shares, and holds roughly US$170 million more cash than debt. That is 37.9 times the midpoint of its own 2026 earnings guide, and 28.4 times the 2027 consensus of US$8.93 a share (MarketBeat, 6 October). That multiple has fallen fast. At the May peak the shares traded at about 60 times the 2026 guide of the time, US$6.30 to 6.40 a share. Today the gap to the large electrical groups is small: Eaton, nVent and Trane each trade at

about 28.5 to 29 times forward earnings, and Schneider Electric at 24 (stockanalysis.com, 6 October). The market now prices Vertiv close to a diversified industrial whose data centre exposure is one division among many. Three things moved the price.

Date	What happened	Move
11 Feb 2026	Vertiv stops reporting orders and backlog each quarter; backlog now annual only	n.a.
14 May 2026	Intraday peak of US$379.94; about 60x the 2026 guide of the time	Peak
29 Jul 2026	Q2 sales about 3% below consensus, EPS beats; timing and supply congestion blamed	down 17% that day
1 Sep 2026	Agrees to buy UtilityInnovation Group for about US$1.45bn in cash, little financial detail	n.a.
9 Sep 2026	Day after the CEO cites congestion in the supply chain for complex products; sector sell-off	down 9.6%

Left: Vertiv month-end close, January 2024 to the 5 October 2026 close, not adjusted for dividends (Yahoo Finance, retrieved 6 October 2026). Right: the events behind the fall from the May peak, from Vertiv filings and the earnings call of 11 February 2026.

Where I differ is in what the July miss and the September fall mean. A supplier that cannot ship fast enough, while its margin rises, is short of capacity, not short of demand. Congestion in making complex products is the claim seen from the factory floor: the products are harder to build because each megawatt needs harder equipment. Vertiv's response has been to raise its full year sales guide twice, from US$13.25 to 13.75 billion in February to US$13.8 to 14.2 billion in July.

The missing backlog is a real loss of evidence, and I said so in September. But it moves the test rather than removing it. The last figure was US$15.0 billion at the end of 2025, up 109%, with fourth quarter organic orders up about 252% and a book-to-bill of about 2.9. The 2026 annual report, due in February 2027, gives the next one.

Valuation, with the working

I value Vertiv on earnings per share, because its profit converts almost fully into cash and it carries little debt. The target looks twelve months out, to October 2027. By then the market will be pricing 2028 earnings, so that is the year I value.

The estimates are mine, not Vertiv's, except where marked as its guide. I tie earnings to adjusted operating profit using the ratio implied by Vertiv's own 2026 guide, about US$6.70 of earnings per share for every US$3.325 billion of operating profit. That carries its current tax rate, interest cost and share count forward unchanged. Growth in 2027 and 2028 sits at Vertiv's own long-run target of 20 to 22% organic growth a year. Margin climbs about one point a year towards its 2030 target of 27%. My 2027 earnings sit about 4.5% below the consensus, so this is not a call that depends on beating the street.

The multiple. I use 28 times 2028 earnings for the base case. That is in line with Eaton, nVent and Trane on forward earnings today, and far below where Vertiv itself traded in May. A business growing at twice their pace with a rising margin should not need a discount to them. 28 x US$10.65 = US$298, rounded to a US$300 target.

Scenarios: three cases, twelve months out

Case	What happens	2028 EPS	Multiple	Value	Change	Weight
Bear	Growth slows to 10 to 12%, margin stalls at 23.5%	US$8.17	22x	US$180	down 29%	25%
Base	Growth at the long-run target, margin up a point a year	US$10.65	28x	US$298	up 18%	50%
Bull	Growth of 22 to 24%, margin reaches 27% early	US$11.52	34x	US$392	up 54%	25%
Weighted	**25 / 50 / 25**			**about US$292**	**up 15%**	

All cases start from the 2026 guide midpoint of US$14.0bn and use the same earnings bridge. The bear and bull EPS use the midpoints of the stated growth ranges (11% and 23% a year). The weighted value uses the unrounded case values of US$179.70, US$298.20 and US$391.80.

Sensitivity: 2028 EPS against the multiple

2028 EPS	24x	28x	32x
US$9.50	US$228	US$266	US$304
US$10.65	US$256	**US$298**	US$341
US$11.50	US$276	US$322	US$368

Most of the range sits above today's price: eight of the nine cells. The call loses money mainly if earnings fall short and the multiple compresses together, which is the bear case. Every figure here is live in the accompanying model, so a change to growth, margin or the multiple moves the target.

Peer landscape

Company	Ticker	Forward P/E	What they make
Vertiv	NYSE: VRT	32.1x	Power, thermal and liquid cooling equipment and service for data centres; pure play
Eaton	NYSE: ETN	~28.5 to 29x	Electrical equipment; data centre exposure is one division among several
nVent	NYSE: NVT	~28.5 to 29x	Enclosures, electrical connections and liquid cooling
Trane Technologies	NYSE: TT	~28.5 to 29x	HVAC and chillers; data centre cooling within a wider building business
Schneider Electric	EPA: SU	24x	Electrical distribution, automation, cooling via Motivair

Forward P/E from stockanalysis.com, retrieved 6 October 2026. Vertiv is also 37.9x the midpoint of its own 2026 earnings guide. Peer multiples are used only to set the base multiple. Schneider Electric bought Motivair and Eaton bought Boyd Thermal for liquid cooling; on 5 October Schneider agreed to buy PTC, a software company, for about US$22.6bn.

Catalysts

When	Event	What I watch
Late October 2026	Third quarter 2026 results	Adjusted operating margin against the 24 to 25% Q3 guide, and against the same quarter of 2025; any change to the full year guide
Second half of 2026	800 VDC power line	Whether Vertiv's 800 VDC equipment, designed alongside Nvidia since May 2025, ships on Nvidia's timetable ahead of its 2027 rack generation
February 2027	2026 Form 10-K and full year results	Year-end backlog against US$15.0bn a year earlier; full year 2026 adjusted EPS against the US$6.65 bottom of the guide
Through mid 2027	Each quarterly release	Margin year on year while sales grow; integration of UtilityInnovation Group

Risks: what would hurt the thesis

The cycle turns. If the largest cloud companies cut data centre spending, Vertiv's volume falls whatever happens to content per megawatt. The bear case is this, and it is a 29% fall.

The margin stalls. The call rests on margin rising while sales grow. A year-on-year fall in any quarter while sales still grow would mean liquid cooling is turning into a commodity. That is the first line of what proves the call wrong.

Buyers build their own. The biggest cloud operators design much of their own hardware, and cooling could follow. I found no report of one doing so at scale yet, but it is the risk the September piece named and it stays on the list.

Rivals with deeper pockets. Schneider Electric bought Motivair and Eaton bought Boyd Thermal for liquid cooling. Schneider's agreed US$22.6 billion purchase of PTC sends money to software, not cooling factories, which slightly helps Vertiv for now.

Acquisitions. Vertiv has agreed five deals this year, the largest being UtilityInnovation Group. It costs about US$1.45 billion in cash, plus up to US$1.15 billion more if profit targets are met, at about 13 times its expected 2027 earnings before interest, tax, depreciation and amortisation. Buying growth at that price only works if the integration is clean.

Weak spots in the evidence. Europe, the Middle East and Africa fell 2.4% organically in the second quarter. Vertiv discloses no single customer's share of sales, and the backlog figure is now annual.

What would change my mind

The call is wrong if adjusted operating margin falls year on year in any quarter to mid 2027 while sales are still growing, or full year 2026 adjusted earnings per share land below the US$6.65 bottom of Vertiv's own guide, or the 2026 annual report shows backlog below the US$15.0 billion of a year earlier.

The other way: a margin above the 24 to 25% guide in the third quarter, together with a 2026 backlog well above US$15.0 billion, would move the base case towards the bull case.

Conclusion

The September piece argued that each AI megawatt holds more of what Vertiv makes. A year of margins says that is happening. The market has spent five months treating Vertiv as a volume story near its peak, and has cut the multiple of this year's earnings from about 60 times to about 38. The price now pays for the volume but not for the richer content. LONG, medium conviction, twelve-month target US$300.

Appendix: forecast assumptions

Assumption	2026	2027E	2028E	Basis
Net sales growth	37% (guide midpoint)	21%	20%	Vertiv long-run target, 20 to 22% organic a year
Adjusted operating margin	23.8% (guide midpoint)	25.0%	26.0%	About a point a year towards the 2030 target of about 27%
EPS per US$bn of adjusted operating profit	US$2.015	US$2.015	US$2.015	US$6.70 / US$3.325bn, 2026 guide midpoints
Target multiple			28x	In line with Eaton, nVent and Trane forward

About this note

I wrote this note and built the accompanying model independently. It is not a product of any bank or broker. It tests a claim from my journal piece of 25 September 2026, thephysicallayer.fyi/journal/every-megawatt-got-harder; all notes and their track record are at thephysicallayer.fyi/research. Figures taken from company filings are labelled as such; derived figures are marked; the forecasts, target and call are my own estimates and my own view. I hold no position in Vertiv. Personal research, not investment advice.
