TEXAS INSTRUMENTS INCORPORATED

Nasdaq: TXN | Analog and embedded chips, including power chips for AI servers | Dallas, Texas

Tommy Lau | 6 October 2026 | Initiation of coverage | Independent research

INITIATE AT NO CALL	**Target price:** None (no call)	**Last price:** US$294.90 (Nasdaq close, 5 October 2026)	**Upside:** Base value US$280 (-5%)

Texas Instruments' data centre business is real. At US$295, the shares already pay for a full analog upturn as well.

TI makes many of the small power chips that step electricity down to an AI processor. On 2 October I argued that the move to 800 volt racks turns them into a growing data centre business. The claim is holding: data centre revenue doubled in a year, and on my working it reached about 12% of revenue in the second quarter, a third of TI's growth.

The obvious objection is that the stock is mostly an analog-cycle bet. That is right. Swinging the rest of TI from my bear to my bull case moves 2028 earnings by US$3.90 a share; doing the same to data centre moves them by US$1.58. At US$294.90 the shares are 35 times my 2026 earnings and need 2028 revenue about 36% above the 2022 peak.

My call: NO CALL, medium conviction. My base case is worth US$280, down 5%. A turn in the cycle is US$168 (down 43%), against a bull case of US$368 (up 25%). I would revisit below about US$244.

Stock data
LAST PRICE **US$294.90, Nasdaq close 5 October 2026; 52-week range US$152.73 to 334.03**
MARKET VALUE **About US$271bn on 920m diluted shares; net debt US$7.1bn at 30 Jun 2026**
P/E ON MY ESTIMATES **34.7x 2026E, 29.1x 2027E, 26.3x 2028E**
CONSENSUS **EPS US$8.49 2026, US$10.64 2027; forward P/E 30.5x; target US$325 (stockanalysis.com)**
DIVIDEND **US$1.52 a quarter from November, yield 2.1%**
FREE CASH FLOW **US$6.5bn in the 12 months to June 2026, incl. US$1.2bn CHIPS Act cash**
DATA CENTRE **9% of 2025 revenue; about 12% in Q2 2026 on my working**
Q3 2026 GUIDE (22 JUL) **Revenue US$5.65 to 6.15bn; EPS US$2.23 to 2.57; tax about 13%**
NEXT RESULTS **Q3 2026: Wednesday 21 Oct 2026, 3:30pm Central time**

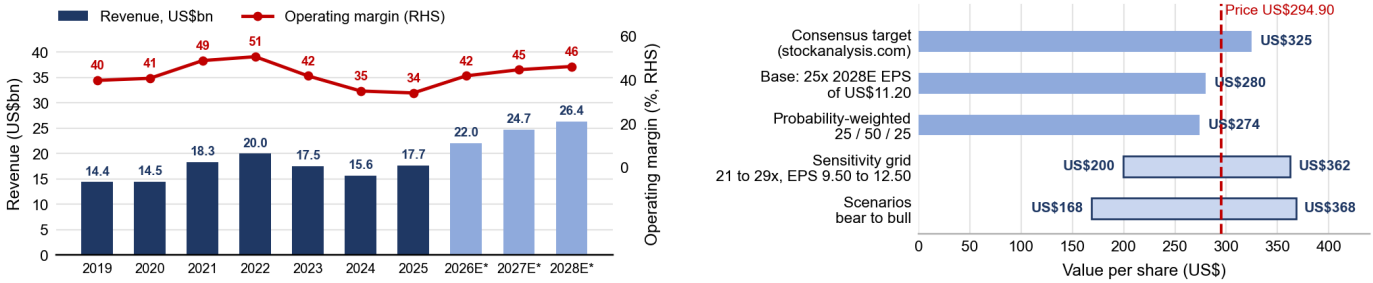

Key financials

US$ billion unless stated	2022A	2024A	2025A	2026E*	2027E*	2028E*
Revenue	20.03	15.64	17.68	22.04	24.73	26.35
Of which data centre	n.d.	n.d.	1.5	2.77	4.02	5.23
Revenue growth (%)	9	(11)	13	25	12	7
Gross margin (%)	68.8	58.1	57.0	not forecast	not forecast	not forecast
Operating margin (%)	50.6	34.9	34.1	41.9	44.7	46.2
Diluted EPS (US$)	9.41	5.20	5.45	8.50	10.15	11.20
P/E at US$294.90 (x)	31.3	56.7	54.1	34.7	29.1	26.3
Depreciation	0.93	1.51	1.92	2.30	2.50	2.60
Capital spending	2.80	4.82	4.55	2 to 3		

**2026E to 2028E are my own estimates; n.d. = not disclosed. 2026E uses the reported first half plus my third quarter (revenue US$5.95bn, EPS US$2.40, the guide midpoint) and fourth (US$5.8bn, US$2.28). Ahead, operating profit rises by 75% of extra revenue before depreciation, less extra depreciation;*

EPS = (operating profit less about US$0.3bn net interest) x (1 - 13% tax) / 920m shares. 2026 depreciation and capital spending are TI's guides. History from TI's Forms 10-K (SEC XBRL). Silicon Labs is excluded.

Two charts: an upturn I expect to mature, and a valuation that sits around the price

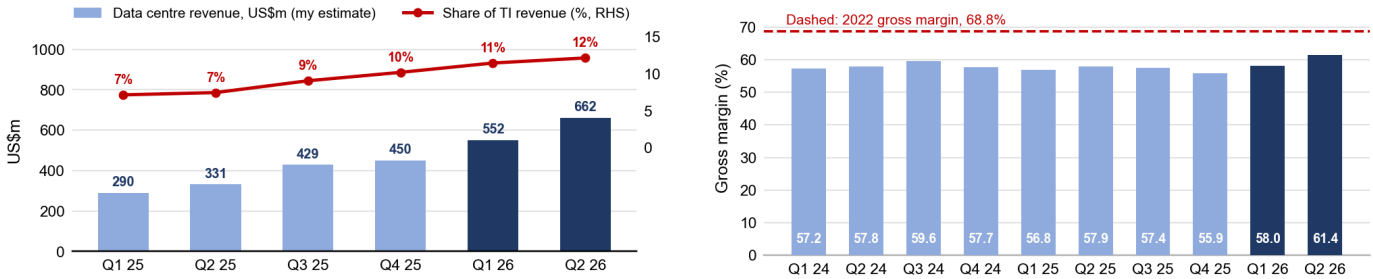

Left: revenue and operating margin, 2019A to 2028E; 2019A to 2025A per TI, the rest my estimates. Right: value per share from the base case, the probability-weighted cases, the sensitivity grid and the bear to bull range, against the US$294.90 price (red) and the stockanalysis.com average analyst target, retrieved 6 October 2026.

The thesis: the valves under the sink

Go back to the water main from the October piece. Water arrives at a pressure that would blast a glass out of your hand, and a row of cheap valves under the sink steps it down to the steady trickle the tap needs. The AI processor is the tap. TI makes many of the valves: power stages, converters, electronic fuses and hot-swap controllers, each selling for cents or a few dollars.

How big data centre has become. TI first reported data centre as its own market for 2025: 9% of revenue, about US$1.5bn, up 64%, leaving the year at about US$450m a quarter. Since then TI gives only growth rates: about 90% in the first quarter of 2026, and in the second a doubling on a year earlier and about 20% on the first quarter. Those rates are enough to size it. On my working, data centre was about US$662m in the second quarter, 12% of revenue, and supplied 33% of TI's US$1.0bn rise on a year earlier.

Which racks it comes from. That doubling comes from today's racks at 48 and 54 volts. In July TI said the 800 volt design will be phased in, with more conversion stages and more of its parts per rack. The claim's 800 volt mechanism is still ahead of TI's numbers, not behind them.

Left: data centre revenue and share of TI revenue by quarter, my derivation from the growth rates TI gave on its calls of 27 January, 22 April and 22 July 2026 (TI does not disclose quarterly sizes). Right: gross margin by quarter, Q1 2024 to Q2 2026, against 2022 (dashed). Source: TI quarterly earnings releases; SEC XBRL company facts.

The factory build. TI spent about US$22bn on capital projects from 2021 to 2026, counting the 2026 guide midpoint. The first Sherman fab began production on 17 December 2025, and TI says a chip made on 300mm costs about 40% less than on 200mm. Capital spending falls to US$2 to 3bn in 2026, and CHIPS Act grants and tax credits return part of it. Free cash flow rose from US$1.5bn in 2024 to US$6.5bn in the twelve months to June 2026.

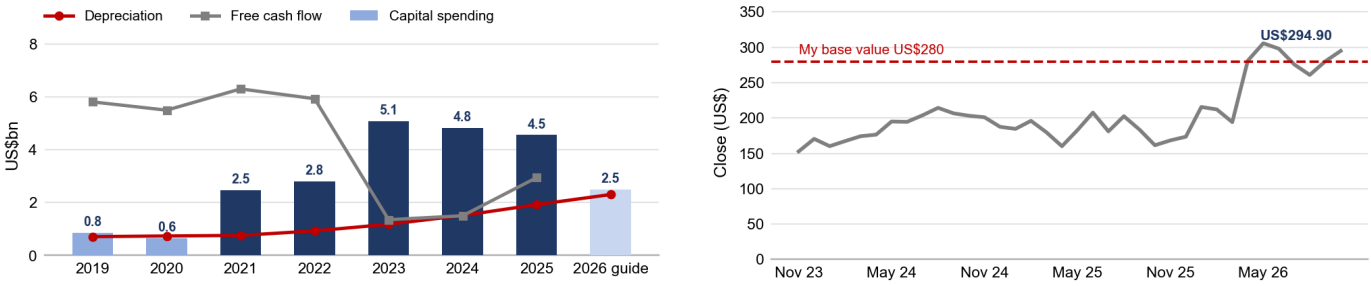

The factories are not yet full. On the July call TI said loadings rose through the second quarter and were still rising into the third, and that it has empty clean room space ready to equip. The margin is also 7 points below 2022's 68.8%, on revenue of about what TI earned in the year to June 2026, mostly because depreciation rose from US$0.93bn in 2022 to US$1.92bn in 2025, with US$2.2 to 2.4bn guided for 2026. This matters: partly filled factories leave room for the margin to rise, but the larger fixed cost base makes earnings fall faster if the cycle turns.

Variant perception: what the market prices in, and where I differ

At US$294.90 TI is worth about US$271bn, with net debt of about US$7bn before the US$7.5bn Silicon Labs purchase, due to close in the first half of 2027. That is 34.7 times my 2026 estimate of US$8.50, in line with the US$8.49 consensus, and 29.1

times my 2027 estimate of US$10.15 (27.7 times the US$10.64 consensus). On TI's own framework, my 2026 revenue implies free cash flow of about US$9.5bn, US$10.35 a share: a 3.5% yield, including CHIPS Act cash.

What the price needs. By October 2027 the market will price 2028. At 25 times, US$294.90 needs 2028 earnings of US$11.80, which on my margin bridge needs revenue of about US$27.2bn: 36% above the 2022 peak of US$20.0bn, and a fourth straight year of growth. In the last cycle revenue grew two years running, then fell 22% over the next two.

Left: capital spending, depreciation and free cash flow (TI's definition, including CHIPS Act proceeds), 2019 to 2025, with 2026 guide midpoints (SEC XBRL company facts; TI 2025 Form 10-K and 27 January 2026 call). Right: TXN month-end close, November 2023 to the 5 October 2026 close, not adjusted for dividends (Yahoo Finance, retrieved 6 October 2026), against my base value.

Where I differ. I agree data centre is real and fast-growing. I differ on how much of the price it can carry. Holding one driver at my base and swinging the other from bear to bull: data centre (25% to 60% growth in 2027, 15% to 40% in 2028) moves 2028 earnings by US$1.58 a share; the rest of TI (an 8% fall to 12% growth in 2027) moves them by US$3.90. The cycle in factories, cars and phones is 2.5 times the bigger driver. So the objection is right about the stock, even though the AI exposure has grown faster than it assumes.

Industrial grew about 30% on a year earlier in the second quarter. Part of that is customers restocking after two years of running inventories down, which flatters a quarter or two. TI's own inventory fell from 222 days at the end of 2025 to 196 days in June: demand is catching up with its stock.

Valuation, with the working

I value TI on earnings per share twelve months out, so on 2028, and cross-check against free cash flow yield, the measure TI itself targets. Revenue is built in two parts, data centre and the rest. Operating profit rises by 75% of each extra dollar before depreciation, the middle of TI's 70 to 85%, less extra depreciation of US$0.2bn in 2027 and US$0.1bn in 2028. The same fall-through applies in a downturn.

The multiple. I use 25 times 2028 earnings. The six analog and power peers trade at a median of 23.3 times forward earnings; TI earns a premium for its own factories, its cash flow and 23 years of dividend increases, but 2028 would be late in an upturn. 25 x US$11.20 = US$280.

Scenarios: three cases, twelve months out

Case	What happens	2028 EPS	Multiple	Value	Change	Weight
Bear	The upturn turns: rest of TI falls 8% then 2%; data centre grows 25% then 15%	US$7.66	22x	US$168	down 43%	25%
Base	The upturn matures: rest grows 7.5% then 2%; data centre 45% then 30%	US$11.20	25x	US$280	down 5%	50%
Bull	The upturn runs: rest grows 12% then 6%; data centre 60% then 40%	US$13.14	28x	US$368	up 25%	25%
Weighted	**25 / 50 / 25**			**about US$274**	**down 7%**	

All cases start from my 2026E (data centre US$2.77bn, rest US$19.26bn) and use the same margin bridge. Even the bear case keeps 2028 revenue (US$21.4bn) above 2025; earnings fall because the margin falls with volume across a larger cost base. The bear case loses more than the bull case gains.

Sensitivity: 2028 EPS against the multiple

2028 EPS	21x	25x	29x
US$9.50	US$200	US$238	US$276
US$11.20	US$235	**US$280**	US$325
US$12.50	US$262	US$312	US$362

Only 3 of the nine cells sit above today's price. To make money from here, TI needs earnings above my base and a multiple close to today's. Every figure is live in the accompanying model, so a change to growth, fall-through or the multiple moves the value.

Peer landscape

Company	Ticker	Forward P/E	What they make
Texas Instruments	Nasdaq: TXN	30.5x	Analog and embedded chips, mostly made in its own 300mm fabs
Analog Devices	Nasdaq: ADI	26.3x	Analog, mixed-signal and power management chips
Infineon	XETRA: IFX	24.5x	Power semiconductors, including server power stages
onsemi	Nasdaq: ON	22.1x	Power and sensing chips, silicon carbide
Microchip	Nasdaq: MCHP	20.7x	Microcontrollers, analog and power chips
NXP	Nasdaq: NXPI	14.5x	Automotive and industrial processors and analog
Monolithic Power	Nasdaq: MPWR	46.1x	Power modules and converters, large AI server exposure

Forward P/E from stockanalysis.com, retrieved 6 October 2026 (Infineon from an intraday price that day). TI at 30.5 times sits between the ordinary analog makers and Monolithic Power, the power specialist with large AI server sales. Multiples only; no view on the peers' shares.

Catalysts

When	Event	What I watch
21 Oct 2026, 3:30pm Central	Q3 2026 results and call	Revenue against US$5.65 to 6.15bn; gross margin as loadings rise; data centre growth; industrial momentum; Q4 guide
10 November 2026	Raised dividend first paid	US$1.52 a quarter, raised on 17 September
January 2027	Q4 2026 results	2027 capital spending and depreciation; any sign the industrial restock is ending
First half of 2027	Silicon Labs expected to close	Financing, interest cost and deal charges
2027 and after	800 volt racks phase in	Named operators adopting 800 volts; TI design wins in the first conversion stage

Risks: what would hurt the view

The upturn runs longer. The bull case and the main risk to a no call. Restocking could last into 2027, and with empty clean room space and falling capital spending each extra dollar carries a high margin. TI also said on the July call that it had started raising prices, which builds through the second half. A gross margin of 65% or more would be the clearest sign.

The upturn turns. The bear case. Industrial and automotive are two thirds of revenue, and 30% industrial growth will not repeat for long. The new fixed cost base makes earnings fall faster than revenue.

The data centre share is my estimate. TI gives rates, not sizes; different rounding could move my 12% by a point or so. The conclusion holds across that range. **800 volt timing and rivals.** TI says the design will be phased in; Infineon, Monolithic Power and Analog Devices compete for the same sockets. **Silicon Labs.** About US$0.8bn of revenue and up to US$5bn of new borrowing, neither in my numbers.

What would change my mind

Into a call: a price below about US$244, which would put my base case 15% above it; or third quarter results showing data centre at 15% or more of revenue while industrial still grows; or a gross margin of 65% or more.

The call is wrong if full year 2027 revenue reaches US$26bn or more with data centre above 15% of it, or gross margin reaches 65% or more in any quarter to June 2027, or the shares trade above US$340 by October 2027 without either.

Conclusion

The October piece argued that the move to 800 volt racks turns TI's cheap power chips into a growing data centre business. TI's own numbers say the business is real: doubled in a year, about 12% of revenue on my working, a third of recent growth, and all of it before 800 volts arrives. The objection is still right about the shares: the analog cycle moves earnings 2.5 times as much as data centre does, and the price already assumes a fourth straight year of growth. My call: NO CALL, medium conviction. Revisit below about US$244.

Appendix: forecast assumptions

Assumption	2026E	2027E	2028E	Basis
Data centre growth	85%	45%	30%	H1 2026 derived from TI's rates; H2 US$0.76 and 0.80bn mine
Rest of TI growth	19%	7.5%	2%	Third and fourth years of the analog upturn
Fall-through before depreciation		75%	75%	TI: 70 to 85% (22 July 2026 call)
Extra depreciation, US$bn		0.2	0.1	TI: 2.2 to 2.4bn in 2026, rising more slowly in 2027
Tax rate	13%	13%	13%	TI guide for Q3 2026; 13 to 14% for 2026
Target multiple			25x	Peer median 23.3x; TI 30.5x today
